

Grow Potatoes in a Bag

If you don't have a garden but want to grow some potatoes, try using potato bags!

1

First of all, you'll need to "chit" your seed potatoes. This means placing them in a cool, dry place for around one month until they sprout (mostly) at one end.

3

Place 1-3 seed potatoes in the bag, sprout side up, then top up the bag with more compost.

You Will Need

- A potato bag
- Seed potatoes
- Compost

Chit your potatoes from late January and plant them in March or April.

2

Half-fill your potato bag with compost when your potatoes are ready to be planted.

Move your potato bag to a spot that catches the sun, then water the potatoes.

4

6

Your potatoes are ready to harvest once the flowers have died and the leaves have turned yellow-brown. Simply pull up the plants to find your potatoes!

5

Check on your potato plants regularly, making sure to keep the compost moist. After a while, pretty flowers will appear!

Top tip: "First early" potatoes are ready to be picked in June or July. "Second earlies" are ready in July and August and "Maincrop" potatoes are ready from August to November.
